12 | Global standard for determining ADF and lignin

Today the requirements for a well balanced compound feed have become increasingly higher. Desirable fibre content in the feed yields better breeding and higher cost efficiency, but requires more analysis and quality control.

18 | Alberta and Shanghai team up to cut pollution

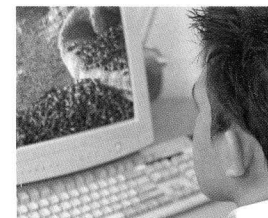

Canola is at the centre of recent efforts between the Alberta Research Council and the Shanghai Academy of Agricultural Science to reduce phosphorous in animal waste by genetically modifying diets.

While GMOs continue to meet with resistance around the world, Feed Tech sources say the risks associated with genetic modification are much less troublesome than the dangers of industrial livestock pollution.

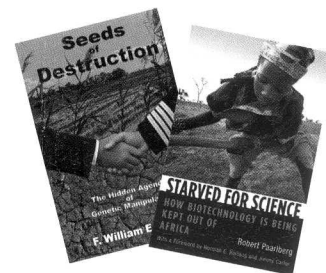

24 | ID-Feed: new electronic tool for feed classification

Wouldn't it be handy to base the classification of all feed products (compound feed and feed additives) on a limited series of simple questions? Fefana agrees and therefore developed a simple electronic tool - ID Feed - for feed companies to find the regulatory definition of feed products. It is not a substitute for current legislation but a tool for better streamlining and transparency.

26 | EU remains in limbo about GMO crop policy

Seven countries in the European Union commercially produce genetically modified crops. Spain is by far the largest producer. Five countries continue to maintain national bans. At the same time, the EU is a major importer of GM-products. This complex situation continued throughout 2008.
