Cargill facility awarded US Feed Mill of the Year

## 08 | What really matters: Quality and regulatory affairs

Mature animal feed markets have become accustomed to a well-established balance of supply and demand. This equilibrium is severely affected by outbreaks of animal diseases or feed contamination. Quality control has never been as important and it can be the backbone of a company's marketing strategy.

## 14 | Fighting fungi in grain storage preserves cereal quality

The main objective of proper grain storage is to maintain the quality and characteristics that the grain possessed immediately after harvesting and drying. The quality of grain cannot be improved during storage. Grain improperly harvested and dried will remain of low quality no matter how well it is stored.

## 17 | Agri Vision 2009: Shifting horizons

The fifth edition of Agri Vision to be held in June in the Netherlands, will take place in a completely different environment to that of two years ago. Optimism, growth and high feed prices have been replaced by care, recession and volatility. Organising company, Nutreco will encourage delegates to think about joint, global solutions.

## 21 | Turning up the heat with enzyme technology

In efforts to make feed as safe as possible heat is often used in the conditioning phase and during pelleting. Not all ingredients can survive these treatments and especially enzymes there is the choice to either add these post pelleting or make them more heat resistant.
